

panacea stock archiving for sage line 500 and sage 1000

Sage Line 500 and Sage 1000 lack the ability to archive stock which means that the stock tables can become very big with a large proportion of records relating to products that are no longer current. Panacea's Stock Archiving module gives the user the ability to archive stock items from all of the relevant tables in Sage to copies held in either the Sage database or another database held on the Sage server or another server.

Do you:

- ◀▶ Have obsolete products residing in Sage?
- ◀▶ Accidentally enter obsolete products onto sales orders, purchase orders and works orders?
- ◀▶ Encounter frustration scrolling through obsolete products?

Your Sage system could run faster and your reports could become more relevant if you took the time to clear down your stock files on a regular basis.

How can Stock Archiving deliver your business results?

Using Panacea's Stock Archiving module you can now quickly highlight stock records that can be archived and archive them to a local or remote location.

The Stock Archiving module will do all the hard work, validate that Sage's business rules are not affected and guarantee that data integrity is maintained.

Once archived the stock records can still be recovered at a later date should you need them, they'll fit straight back into the Sage tables.

If you would like a demonstration of the Stock Archiving module please contact your account manager or email
